PREPARATION OF PAPERS FOR THE QUARTERLY JOURNAL

Content and scientific standard

In general, scientific papers in the *Quarterly Journal* describe results of new research in the fields of the atmospheric sciences, applied meteorology and physical oceanography. Papers describing new applications of meteorological or oceanographical methods or data, or describing new techniques, mathematical or instrumental, the primary application of which is to atmospheric or oceanographic science, are also accepted. Comprehensive review articles are also published from time to time. The work described should not have been previously published. If any part of the work has been anticipated elsewhere appropriate acknowledgement should be made.

A *Notes and Correspondence* section of the Journal contains short articles describing minor investigations and correspondence commenting on published papers.

Submission of papers

Only papers written in English will be considered for publication. Four copies, each complete with diagrams, should be supplied, addressed to the sub-editor. No page charges are made. A paper on acceptance becomes the property of the Society.

Refereeing

Papers accepted for consideration are normally reported on by two referees whose advice is used by the Editing Committee in reaching decisions on publication. This process takes some time but the author of the paper is informed of the committee's decision as soon as possible. Revised versions of papers may be forwarded to the original referees and four copies of revised versions should be submitted together with a statement indicating changes made.

Preparation of papers

Papers must be lucid and unambiguous but should also be concise; verbosity, duplication and unnecessary tables and figures are to be avoided.

Papers should be preceded by a summary providing an abbreviated version of the paper which should include the main results in addition to the method used. Summaries should be understandable when read separately from the paper and should not normally contain references. Where approximations or physical assumptions are made in the course of an argument these must be clearly identified. All symbols used should be defined either at the first use or in an appendix unless the notation is standard in which case this should be stated. Where detailed mathematical work is essential it is often best presented in an appendix.

Papers, including reference lists and captions for figures, should be clearly typed with at least double spacing and all pages should be numbered. One copy of an accepted paper must use only one side of the paper and have margins of at least 3 cm all round. For convenience during refereeing copies of the paper in more compact form (e.g. double sided or reduced photocopies) are acceptable.

Words or symbols should be underlined only when they are to be printed in italics, to emphasize a word of phrase. Spelling should conform to the preferred spelling of the Shorter Oxford Dictionary. Typescripts should be thoroughly checked by the authors before submission.

Titles should be short; unusual or unconventional words, symbols etc. should not be used.

Sections after the summary should be numbered serially in arabic numerals. Subsections should be marked (*a*), (*b*), etc. Paragraph beginnings should be indented or marked; additional blank lines between paragraphs are inadequate.

Footnotes are best avoided; if found necessary they should be inserted immediately below the line to which they refer and separated from the rest of the text by lines across the page above and below.

Tables, however small, should be numbered serially in arabic and should be so referred to in the text. References such as 'in the following table' or 'in the above table' must be avoided. An appropriate place for each table should be indicated. Tables should be provided with headings which should be short. Vertical rulings in tables should not be used unless absolutely necessary. Comments concerning entries in tables are best given in footnotes to the table.

Illustrations

Diagrams for an accepted paper must be of draughtsman standard and it is helpful if copies of diagrams submitted with a paper are of the size that they are to appear in the journal. This ensures that the published diagrams will be legible and is convenient for referees. Diagrams are preferably submitted in their final form and where substantial differences exist between the submitted figures and the final versions, authors may be required to redraw the latter. Original diagrams, which should be retained by the author until a paper has been accepted, are best submitted as glossy prints of high contrast and final size but drawings in black ink on linen or white paper are acceptable.

Authors must bear in mind that illustrations, when they appear in the Journal, will be no larger than is necessary for reasonably easy reading. It is especially important for authors to ensure that the lines, shading and lettering will be legible after the necessary degree of reduction. Diagrams should contain only sufficient lines to illustrate an argument. Excessive detail should be excluded. Where diagrams are based on computer-produced material it is often necessary to redraw with fewer and bolder lines and bold lettering. Legends forming part of a diagram should also be bold enough to ensure legibility after reduction. Authors will be required to have diagrams redrawn if line thicknesses or lettering styles make the necessary degree of reduction impracticable.

Care should be taken to ensure that where symbols appear on a diagram the same symbol is used as in the text.

Maps should if possible be orientated with the meridian through the centre of the area parallel to the edges of the map. Latitude/longitude markings should be included if this does not obscure important details.

Where figures are composed of several parts these should be identified by letters (a), (b) . . . . The identifying letter should be included within each part of the figure.

Illustrations should have self-explanatory legends so that they can be understood without reference to the text. A separate consolidated list of figure legends should be supplied, set with double line spacing.

Where half-tone figures are essential, sharp prints on glossy paper should be provided. Authors should consult the editor before submitting colour photographs.

Illustrations should be numbered in arabic and an appropriate place for each in the text should be indicated. Occasional forward references to figures, and backward references, are acceptable but where these occur frequently the text should be restructured or alternative diagrams used.

Authors are encouraged to advise the sub-editor when they wish diagrams to appear, for example, on one page.

References

Bibliographical references should be made in the text by giving the name of the author and year of publication e.g. (Shaw 1925); where there are three or more authors the form Shaw *et al.* 1926 should be used. Details of references are listed in alphabetical order of authors' names and in date order for each author. The reference should include all authors' names, titles of papers and last as well as first page numbers. References to internal and project reports should be avoided but if essential they should be detailed and contain the name of an organization from which they can be obtained. References to material which has been 'submitted' are not acceptable but authors may wish to use 'personal communication' or an internal report and update the reference at proof stage if the material is published. Where a paper relies heavily on material which is 'in press' copies of the material should be supplied with the submitted paper for use by the referees.

The names of journals will be abbreviated in accordance with BS4148, Part 2 (1975); *The Abbreviation of Titles of Periodicals*, but if authors prefer they may give the names in full and they will be abbreviated editorially.

Mathematics

Mathematical script must be prepared with great care; Latin, Greek and German alphabets together with special European characters may be freely used. One copy of the paper should include a typographical definition of symbols used which may take the form of marginal pencilled notes. The use of typewritten and handwritten versions of the same symbol causes confusion and should be avoided. Care should also be taken to distinguish between characters of similar shape e.g. c, C; l, 1; k, K, κ, ζ, ξ. Where subscripts or superscripts are required this should be made clear.

Expressions requiring symbols at different levels should be avoided (except for simple fractions and barred or dotted single letters) especially in the body of the text. For example: a/b; dy/dx; $\sqrt{(a+b)}$; $\exp[(x^2+y^2)/r^2]$; are better than

$$\frac{a}{b}, \qquad \frac{dy}{dx}, \qquad \sqrt{a+b}; \qquad e^{(x^2+y^2)/r^2}$$
